

TRACK CONDITION CHANGES, STREAMLINE INTERVENTION AND IMPROVE OUTCOMES.

When older adults experience a change in health, they can't always recognize it or articulate it to caregivers. And nurses can't be everywhere to constantly monitor each resident's status. Now they don't have to be.

WISDOM2ACT Powered by Eldermark makes it easy for on-site caregivers to record and track significant condition changes electronically—and in real time—giving clinicians and nurses the data needed to intervene with appropriate care in a timely fashion.

WISDOM2ACT ENABLES:

- Real-time communication from caregivers closest to residents
- Early and immediate response to changes in well-being
- The mitigation of potentially adverse resident transition events
- Early clinical interventions, especially in disease process management
- Effective collaboration among the entire care team, including the primary physician and other care partners
- Lower care costs and improved patient outcomes

WHAT'S IN A NAME?

WISDOM2ACT was carefully developed to record and alert clinicians of changes in:

- W** - weight
- I** - intake
- S** - skin condition
- D** - differences unspecified
- O** - output
- M** - mobility
- 2** - our 2-step process of "record" and "confirm"
- A** - agitation or mood
- C** - communication
- T** - tiredness or weakness

A POWERFUL AID TO COLLABORATIVE CARE

Part of Eldermark's innovative Point of Care mobile software, WISDOM2ACT allows community staff to use their handheld device to input key resident condition changes—such as weight, food intake, mobility and behavior—at the moment the change is observed. Data is integrated into the Point of Care system. If a noted change requires clinical attention, an alert is sent to the clinician's desktop—allowing for early intervention and the potential avoidance of transitional events.

FOUR EASY STEPS TO EARLY INTERVENTION:
